

# Feasibility Analysis

---

**Project Name:** BusinessStats

**Name:** Ashwin Pilgaonkar (U101114FCS052)

**Section:** S2

The main purpose of performing a feasibility analysis on a project, is to test whether it is worthy of the time and effort spend in implementing it. If a project is not technically or economically feasible, there is no point in trying to implement it.

## Analysis of problem

This section answers the following questions-

---

- What if the system wasn't implemented?
  - What are current process problems?
  - How will the proposed system help?
  - What will be the integration problems?
  - Is new technology needed?
- 

Our client has given us specific requirements to implement into an app. This would help him in the following ways-

It will make it easier for him to manage his business when he is away from his PC.

Sending an auto generated email saves his time as he doesn't have to manually write and send the email.

---

He would be able to generate a standardized flight/train schedule right from his phone and view/search through the results even without an internet connection.

There are currently no integration/process problems and no new technology is required to implement the project.

## **Economic Feasibility**

---

This project is completely economically feasible. We are doing it for free as it is part of our Software Engineering course project (and Open Source) but the client would be ready to pay us for it.
